Supplementary Materials and Methods
Figure S1. Peak areas of parent peptides resulting from different BSA digestions
Figure S2. Peak areas of parent peptides before and after heat treatment
Figure S3. Amino-acid sequence of BSA
Figure S4. Peak area progress curves of parent peptides during their incubation in water
Figure S5. Peak area progress curves of parent peptides during their incubation with MC1
Figure S6. Peak areas of parent peptides during their incubation with MC1, MC2, and MC3
Figure S7: Peak areas of parent peptide dilutions
Figure S8. Removal of parent peptides containing selected amino-acid residues at P2P1 site
Figure S9. Removal of parent peptides containing selected amino-acid residues at P1'P2' site Figure S10. Names and structures of selected peptide-based antibiotics

Table S1. Amino-acid sequences and HPLC-HRMS acquisition parameters of parent peptides
Table S2. Characteristics of the activated sludge processes
Table S3. Amino-acid sequences and HPLC-HRMS parameters of product peptides MC1
Table S4. Amino-acid sequences and HPLC-HRMS parameters of product peptides MC2
Table S5. Amino-acid sequences and HPLC-HRMS parameters of product peptides MC3
Table S6. Information on parent and product peptides related to hydrolyzed peptide bonds

## Supplementary Materials and Methods

Chemicals. Bovine serum albumin (BSA, article number: A2153), sodium phosphate monobasic (S8282), sodium phosphate dibasic (S7907), ammonium bicarbonate (09830), and calcium chloride (C4901) were obtained from Sigma-Aldrich. Trypsin (90058), formic acid (28905), dithiothreitol (DTT, R0861), and sodium dodecyl sulfate (SDS, 064382) were obtained from Thermo Fisher Scientific. Iodoacetamide (IAA, 122270050) was obtained from Acros Organics. Trifluoroacetic acid (TFA, 20420) was obtained from Honeywell. Acetic acid (044721) was obtained from Oakwood Chemical. LC-MS grade water (58201) and methanol (58215) were obtained from OmniSolv. Milli-Q water was prepared with an Advantage A10 (Millipore).

Total suspended solids quantification. We determined the total suspended solid content of wastewater sludge by transferring 30 mL of suspended sludge onto a preweighted glass microfiber filter (Whatman GF/F, product number: 1825-047) that had been mounted into a filter holder (Nalgene, 300-4000). After applying a vacuum and drying the filter paper $\left(120^{\circ} \mathrm{C}, 2 \mathrm{~h}\right)$, we re-reweighted the filter paper and calculated the solid content from the mass difference.

Protein concentration measurements. We used the Pierce bicinchoninic acid (BCA) Protein Assay kit (Thermo Fisher, 23225) and a microplate reader (Tecan, Infinite M200-pro) to determine the protein concentrations of the enzyme extracts (14).

Figure S1. Peak areas of parent peptides resulting from the digestion of bovine serum albumin (BSA) with trypsin at different trypsin/BSA ratios (w/w).

Figure S2. Peak areas of parent peptides before and after heat treatment.

Table S1. Amino-acid sequences (single-letter abbreviations) and high-performance liquid chromatography high-resolution mass spectrometry (HPLC-HRMS) acquisition parameters of parent peptides.

Figure S3. Amino acid sequence (single-letter abbreviations) of bovine serum albumin (BSA, UniProt-ID: P02769). Sequences of parent peptides that were detected by high-performance liquid chromatography coupled to high-resolution mass spectrometry (HPLC-HRMS) are highlighted in grey.

Figure S4. Peak area progress curves of parent peptides during their incubation in pH -buffered Milli-Q water. Points represent data from single measurements. Peptide T12 was not detected at 24 h .

Table S2. Characteristics of the activated sludge process of the wastewater treatment facilities from which microbial communities (MCs) were derived.

|  | Location | Process $^{1)}$ | Hydraulic <br> retention <br> time $(\mathrm{h})$ | Solids <br> retention <br> time $(\mathrm{d})$ | TSS <br> $(\mathrm{g} / \mathrm{L})^{2)}$ | Protein <br> concentration <br> $\left.(\mathrm{mg} / \mathrm{L}){ }^{3}\right)$ | Protease <br> activity <br> $(\mathrm{a.u})^{3)}$ |
| :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| MC1 | Ithaca | CAS | 2.7 | 5.4 | $1.90 \pm 0.02$ | $14.43 \pm 0.07$ | $1.00 \pm 0.06$ |
| MC2 | Dryden | SBR | 25 | 25 | $1.80 \pm 0.02$ | $9.90 \pm 0.06$ | $1.57 \pm 0.03$ |
| MC3 | Trumansburg | CAS | 20 | 22 | $3.49 \pm 0.03$ | $10.35 \pm 0.03$ | $1.75 \pm 0.04$ |

${ }^{1)}$ CAS: conventional activated sludge, SBR: sequencing batch reactor, note: none of the three treatment facilities was designed for biological phosphorus removal. ${ }^{2)}$ TSS: total suspended solids. ${ }^{3 /}$ Protein concentration and protease activity were measured on dissolved extracellular enzyme extracts. Protease activities were normalized to the activity measured for MC1.

Figure S5. Peak area progress curves of parent peptides during their incubation with enzyme extract from MC1. Points represent data from single measurements. The missing data points for peptides T12, T32, and T40 indicate that these peptides were not detected at later sampling points.

Figure S6. Peak areas of parent peptides at the onset and at the end of their incubation with enzyme extracts from $\mathrm{MC} 1(\mathbf{a}), \mathrm{MC} 2(b)$, and MC 3 (c). Red arrows indicate parent peptides that were selected for product identification. Error bars represent standard deviations of triplicates.

Figure S7. Peak areas of parent peptides at different concentrations. The concentration (in arbitrary units) is provided relative to the starting concentration of the incubation experiments. Lines represent curves of a linear fit. $\mathrm{R}^{2}$ values (rounded to two decimals) of the linear fit are depicted next to the curves. For peptides that did not show linear relationship between peak area and concentration (based on our criteria: $\mathrm{R}^{2}>0.95$ ), we depicted curves and letters in red. We note that this control experiment was conducted in a different laboratory and with a different peptide solution (i.e., a new digestion with the same reagents was conducted) than the remaining experiments of the study.

Table S3. Amino acid sequences (single-letter abbreviations) and high-performance liquid chromatography high-resolution mass spectrometry (HPLC-HRMS) acquisition parameters of product peptides that were detected for MC1.

${ }^{1)}$ Amino acid residues flanking the hydrolyzed peptide bond (i.e., P1P1') are shown in bold.
${ }^{2}$ )Peak areas of product peptides at the end of the incubations (i.e., at $6 \mathrm{~h}, 3.8 \mathrm{~h}$, and 3.5 h for experiments with enzymes from MC1, MC2, and MC3, respectively) are provided as mean $\pm$ standard deviation of triplicates. *Some products might alternatively result from the hydrolysis of parent peptide T32. **Some products might alternatively result from the hydrolysis of parent peptide T9.

Figure S8. Peak area reduction of parent peptides that contain the amino-acid residue pairs that occurred at the P2P1 site of peptide bonds that were hydrolyzed by enzymes extracted from at least two wastewater microbial communities. Points and error bars represent means and ranges, respectively, of the peak area reduction measured for the three microbial communities. Parent peptide numbers are provided next to the respective points. Black points represent parent peptides for which we detected the hydrolysis of the respective peptide bond by enzymes extracted from at least two microbial communities (Table S6). An additional search for products of the hydrolysis of peptide bonds with EY, FQ, and VS at the P2P1 site (note: these amino-acid residue pairs were selected because they occurred in at least two parent peptides and all of the respective parent peptides showed a mean peak area reduction across the three microbial communities of $>50 \%$ ) resulted in the identification of the following products: (i) amino-acid sequence: TQTALA; exact mass: 604.3301; mass deviation: 1.1 ppm ; charge state: +1 ; retention time: 26 min ; detected fragments: $\mathrm{y} 4, \mathrm{y} 2$; peak area (x10E7) $7.2 \pm 1.5$ (MC1), (ii): amino-acid sequence: LVVS; exact mass: 417.2708; mass deviation: -1 ppm ; charge state: +1 ; retention time: 31 min ; detected fragments: y3, y2; peak area (x10E7) $9 \pm 5$ (MC2). These are products of the hydrolysis of the peptide bond in T42 that contains the amino-acid residue pair VS at the P2P1 site (indicated in blue).

Figure S9. Peak area reduction of parent peptides that contain the amino-acid residue pairs that occurred at the P1'P2' site of peptide bonds that were hydrolyzed by enzymes extracted from at least two wastewater microbial communities. Points and error bars represent means and ranges, respectively, of the peak area reduction measured for the three microbial communities. Parent peptide numbers are provided next to the respective points. Black points represent parent peptides for which we detected the hydrolysis of the respective peptide bond by enzymes extracted from at least two microbial communities (Table S6). An additional search for products of the hydrolysis of peptide bonds with FQ and VS at the P1'P2' site (note: these amino-acid residue pairs were selected because they occurred in at least two parent peptides and all of the respective parent peptides showed a mean peak area reduction across the three microbial communities of $>50 \%$ ) resulted in the identification of the following product: amino-acid sequence: YNGV; exact mass: 452.2140; mass deviation: 1.1 ppm ; charge state: +1 ; retention time: 25 min ; detected fragments: y 3 , y2; peak area (x10E7) $0.90 \pm$ $0.14(\mathrm{MC} 1), 1.8 \pm 0.4(\mathrm{MC} 3)$. This is the product of the hydrolysis of the peptide bond in T13 that contains the amino-acid residue pair FQ at the $\mathrm{P} 1^{\prime} \mathrm{P} 2$ ' site (indicated in blue).

Figure S10. Names and structures of selected antimicrobial peptides Amino acid residues with L-stereochemistry are shown in blue and their single-letter abbreviation is provided next to the respective side chain. Thanatin entirely consists of amino acid residues with L-stereochemistry and its sequence is presented below the structure. Cysteine side chains that form a disulfide bond are shown in red.
