## Figures

<i>Figure S1 - Illustration of the dynamic in a tributary (Site 2) during one month. Pictures show the response to one day of rain (on the 07.11.207)</i> .....	16
<i>Figure S2 – Illustration of the sampling rate (Rs) calculated from the onsite samples concentration for each compound detected in the SDB and the WLP. The regression lines represent the relation between the concentration in the water (Cw) and the Mass in the SDB membrane (Mi). The Cw is the concentration detected in WLP samples. The Mi is the mass detected with the SDB disk. The sampling rate is calculated based on the formula: Cw = Mi / (Rs × t)</i> .....	19
<i>Figure S3 - Correlation of the concentration of Chlorpyrifos detected in in the WLP and PDMS</i> .....	21
<i>Figure S4 – Chlorpyrifos concentrations from PDMS at the different location. (The sample from week 9-10 at site 5 where lost).</i> .....	21
<i>Figure S5 - Mixed risk quotient for three-target organism based on the EQS values and the concentrations of pesticides in rives at each respective time and space.</i> .....	23
<i>Figure S6 – Pesticide concentration from the different drinking sources: boreholes, ponds and springs.</i> .....	24

## **Text S1 – Multi-layered cartridge**

The multi-layered cartridge were composed in a 6 ml empty cartridge (Supelco, Switzerland) as follow: a frit (Polyethylene, 20 um, Supelco, Switzerland), 200 mg of Supelco-Envicarb, another frit, 350 mg of a mixed phase (100mg Strata-X-AW, Phenomenex, Switzerland; 100 mg Strata-X-CW, Phenomenex, Switzerland; 150 mg Isolute ENV+, Biotage, Switzerland), another frit, 200 mg of OASIS HLB (30 um, Waters, Switzerland) and a last frit.

**Figure S2 –** Illustration of the sampling rate (Rs) calculated from the onsite samples concentration for each compound detected in the SDB and the WLP. The regression lines represent the relation between the concentration in the water (Cw) and the Mass in the SDB membrane (Mi). The Cw is the concentration detected in WLP samples. The Mi is the mass detected with the SDB disk. The sampling rate is calculated based on the formula:  $C_w = M_i / (Rs \times t)$

## Text S2 – Non-quantitative screening for OCPs

We organized a pilot study in order to optimize the sampling method and the site location. We used the extract form PDMS samples to check the contamination of OCPs in the surface water in Wakiso, Uganda. The PDMS used for this screening were deployed for 14 days in March 2017 at site location 2 and 3. After the analysis in GC-MS/QQQ for the pyrethroids, we evaporated the hexane until dryness to recondition the samples in isoctane. The analytical measurement was performed by the Central Environmental Laboratory (GR-CEL) at EPFL. They have an optimized method to detect organochlorine pesticides in GC/MS and used it in several studies<sup>1</sup>. The target pesticides are listed in the table S1 below. We only detected tree compounds above the limit of quantification. However, since we did not add internal standard the quantification is difficult. The three compounds are: endrin, pp'DDD and pp'DDT.
